AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A cold cathode light emitting device emitting light by electrons extracted from a cold cathode, comprising:

a plurality of first electrodes;

a plurality of insulating layers laminated in over said plurality of first electrodes;

a plurality of second electrodes provided on said plurality of insulating layers to intersect said plurality of first electrodes with said plurality of insulating layers interposed therebetween, for extracting electrons from said plurality of first electrodes; and

a third electrode opposed to said plurality of second electrodes for emitting light upon receipt of said electrons, with a voltage for accelerating said electrons being applied between said third electrode and said plurality of first electrodes[[,]]; wherein

at least one hole is provided at <u>each intersection</u> intersections of said plurality of first electrodes and said plurality of second electrodes to <u>extend</u> extending through said plurality of second electrodes and said plurality of insulating layers to reach a surface of said plurality of first electrodes,

said at least one hole has having a first diameter d1 at a position where a first of said plurality of insulating layers contacts are in contact with said plurality of first electrodes and a second diameter d2 at a position of where said plurality of insulating layers are in contact with said plurality of second electrodes, where d2 the second diameter is greater than the first diameter d1[[,]]; and

a nanofiber-structure layer is provided on said plurality of first electrodes in an opening portion having corresponding to said first diameter d1 in said at least one hole.

Docket No.: 2257-0246PUS1

2. (Currently Amended) The cold cathode light emitting device according to claim 1, wherein

assuming that said at least one hole is divided into a first section corresponding to a

lowermost insulting layer of said plurality of insulating layers being in contact with said plurality of

first electrodes, a second section corresponding to the remainder of said plurality of insulating

layers located over said lowermost insulating layer, and a third section corresponding to said

plurality of second electrodes; and

said hole has said first diameter d1 is in said first section, said second diameter d2 is in said

third section at an upper part of said second section, and a third diameter dm is at a lower part of

said second section, where dm the third diameter is greater than the second diameter d2.

3. (Currently Amended) The cold cathode light emitting device according to claim 1, wherein

assuming that said at least one hole is divided into a first section corresponding to a

lowermost insulating layer of said plurality of insulating layers being in contact with said plurality

of first electrodes, a second section corresponding to the remainder of said plurality of insulating

layers located over said lowermost insulating layer, and a third section corresponding to said

plurality of second electrodes[[,]]; and

said hole has said first diameter d1 is in said first section, and a diameter in said second

section <u>includes a diameter</u> which decreases to taper toward said plurality of second electrodes.

4. (Currently Amended) The cold cathode light emitting device according to claim 1, wherein:

4

Docket No.: 2257-0246PUS1

assuming that said at least one hole is divided into a first section corresponding to a

lowermost insulating layer of said plurality of insulating layers being in contact with said plurality

of first electrodes, a second section corresponding to the remainder of said plurality of insulating

layers located over said lowermost insulating layer, and a third section corresponding to said

plurality of second electrodes[[,]]; and

said hole has said first diameter d1 is in said first section, and said second section includes a

constant diameter substantially equal to said second diameter \$\frac{d2}{2}\$ throughout said second region.

5. (Currently Amended) The cold cathode light emitting device according to claim 1, wherein:

assuming that said at least one hole is divided into a first section corresponding to a

lowermost insulating layer of said plurality of insulating layers being in contact with said plurality

of first electrodes, a second section corresponding to the remainder of said plurality of insulating

layers located over said lowermost insulating layer, and a third section corresponding to said

plurality of second electrodes[[,]]; and

said hole has said first diameter d1 is in said first section, and said second section includes a

diameter a diameter in said second section which increases to flare toward said plurality of second

electrodes.

6. (Currently Amended) the cold cathode light emitting device according to claim 1, wherein:

an insulating layer of said plurality of insulating layers located over a lowermost insulating

layer of said plurality of insulating layers being in contact with said plurality of first electrodes has

5

the same pattern configuration as said plurality of second electrodes.

Docket No.: 2257-0246PUS1

7. (Original) The cold cathode light emitting device according to claim 1, wherein

a lowermost insulating layer of said plurality of insulating layers being in contact with said

plurality of first electrodes is a deposited insulating layer in which insulative films are deposited.

8. (Original) The cold cathode light emitting device according to claim 1, wherein

a lowermost insulating layer of said plurality of insulating layers being in contact with said

plurality of first electrodes is formed by firing a paste material made of resin containing glass

powder dispersed therein.

9. (Original) The cold cathode light emitting device according to claim 1, wherein

a lowermost insulating layer of said plurality of insulating layers being in contact with said

plurality of first electrodes has a thickness t1, and the remainder of said plurality of insulating layers

other than said lowermost insulating layer has a thickness t2, where t1 is smaller than t2.

10. (Original) The cold cathodes light emitting device according to claim 1, wherein

said plurality of insulating layers are each formed by firing a paste material made of resin

containing glass powder dispersed therein, and

a softening point of said glass powder used for said plurality of insulating layers decreases in

the order of getting closer to said plurality of second electrodes.

6

Application No. 10/811,980 Amendment dated June 9, 2006

Athendment dated Julie 9, 2000

Reply to Office Action of March 9, 2006

11. (Original) An image display comprising a display provided with the cold cathode light emitting

device as recited in claim 1.

12. (Currently Amended) A method for manufacturing the a cold cathode light emitting device as

recited in claim-1, comprising the steps of:

providing a first substrate;

forming a plurality of first electrodes on said first substrate;

forming a first insulating layer on said plurality of first electrodes;

patterning the first insulating layer;

forming a second insulating layer on the patterned first insulating layer;

forming a plurality of second electrodes on said second insulating layer such that the

plurality of second electrodes intersect said plurality of first electrodes with said first and second

insulating layers interposed there between;

patterning the plurality of second electrodes and the second insulating layer, wherein the

patterning of the first insulating layer, the second insulating layer and the plurality of second

electrodes forms a least one hole at each intersection of said plurality of first electrodes and said

plurality of second electrodes extending through said plurality of second electrodes and said first

and second insulating layers to a surface of said plurality of first electrodes;

(a) coating a solvent containing a nanofiber-structure material dispersed therein on a surface

of said plurality of patterned second electrodes and said first and second insulating layers having a

substrate having-said at least one hole formed therein; and

drying said solvent to form a dried film; and

7

DRA/PLC/af/slb

Docket No.: 2257-0246PUS1

Application No. 10/811,980 Docket No.: 2257-0246PUS1 Amendment dated June 9, 2006

Destructe Office Action of March

Reply to Office Action of March 9, 2006

(b) spraying polishing particles at a high pressure onto a surface of said dried film

containing said nanofiber-structure material to remove an unnecessary part of said dried film except

that portion of the nanofiber-structure formed in the at least one hole corresponding to a opening

formed by patterning the first insulating layer.

13. (Currently Amended) The method according to claim 12, wherein

said at least one hole provided at each intersection has a first diameter at a position where a

first of said plurality of insulating layers contacts said plurality of first electrodes and a second

diameter at a position of said plurality of second electrodes, where the second diameter is greater

than the first diameter; and

said polishing particles have a particle diameter ds, such that the first diameter is less than

the particle diameter which is less than the second diameter satisfying such a relation with said first

diameter d1-and said second diameter d2 that d1<ds<d2.

14. (Currently Amended) The A method according to claim 12 of manufacturing the cold-cathode

light emitting device as recited in claim 1, further comprising the steps of:

(a) forming said at least one hole in said plurality of second electrodes and said plurality of

insulating layers and forming a sacrificial layer which covers said plurality of second electrodes

except a portion corresponding to said at least one hole;

(b) coating a solvent containing a nanofiber-structure material dispersed therein on an inner

surface of said at least one hole and on a surface of said sacrificial layer, and drying said solvent to

8

form a dried film;

Application No. 10/811,980 Amendment dated June 9, 2006

Reply to Office Action of March 9, 2006

(e)-spraying polishing particles at a high pressure onto a surface of said dried film containing

said nanofiber-structure material to remove an unnecessary part of said dried film except that

portion of the nanofiber-structure corresponding to a opening formed by patterning the first

insulating layer; and

(d) removing said sacrificial layer.

15. (Currently Amended) The method according to claim 14, wherein

said at least one hole provided at each intersection has a first diameter at a position where a

first of said plurality of insulating layers contacts said plurality of first electrodes and a second

diameter at a position of said plurality of second electrodes, where the second diameter is greater

than the first diameter; and

said polishing particles have a particle diameter ds, such that the first diameter is less than

the particle diameter which is less than the second diameter satisfying such a relation with said first

diameter d1 and said second diameter d2 that d1<ds<d2.

16. (Currently Amended) The method according to claim 15, wherein said sacrificial layer is also

used as a mask for patterning the plurality of second electrodes and the second insulating layer to

form forming said at least one hole in said plurality of second electrodes and said plurality of

second insulating layer layers.

17. (Currently Amended) The A method according to claim 12 of manufacturing the cold cathode

light emitting device as recited in claim-1, further comprising the steps of:

9

DRA/PLC/gf/slb

Docket No.: 2257-0246PUS1

Reply to Office Action of March 9, 2006

(a) forming a lower most insulating layer of said plurality of insulating layers on said

plurality of first electrodes;

(b) selectively removing said lowermost insulating layer to form said opening portion which

constitutes a lower part of said at least one hole one the side of said plurality of first electrodes;

providing a first substrate;

forming a plurality of first electrodes on said first substrate;

forming a first insulating layer on said plurality of first electrodes;

patterning the first insulating layer to form a plurality of open portions;

(c) coating a solvent containing a nanofiber-structure material dispersed therein on an inner

surface of said plurality of open portions opening portion and a surface of said lowermost first

insulating layer, and drying said solvent to form a dried film; and

(d)-planarizing said dried film containing said nanofiber-structure material to remove said

dried film except a part thereof present in said plurality of open portions opening portion;

forming a second insulating layer on the patterned first insulating layer;

forming a plurality of second electrodes on said second insulating layer such that the

plurality of second electrodes intersect said plurality of first electrodes with said first and second

insulating layers interposed there between;

patterning the plurality of second electrodes and the second insulating layer, wherein the

patterning of the first insulating layer, the second insulating layer, and the plurality of second

electrodes forms a least one hole at each intersection of said plurality of first electrodes and said

plurality of second electrodes extending through said plurality of second electrodes and said second

insulating layers to said plurality of opening portions in said first insulating layer.

Application No. 10/811,980 Docket No.: 2257-0246PUS1 Amendment dated June 9, 2006

Amendment dated Julie 9, 2000

Reply to Office Action of March 9, 2006

18. (New) A cold cathode light emitting device emitting light by electrons extracted from a cold

cathode, comprising:

a plurality of first electrodes;

a plurality of insulating layers laminated in said plurality of first electrodes;

a plurality of second electrodes provided on said plurality of insulating layers to intersect

said plurality of first electrodes with said plurality of insulating layers interposed therebetween, for

extracting electrons from said plurality of first electrodes; and

a third electrode opposed to said plurality of second electrodes for emitting light upon

receipt of said electrons, with a voltage for accelerating said electrons being applied between said

third electrode and said plurality of first electrodes, wherein

at least one hole is provided at intersections of said plurality of first electrodes and said

plurality of second electrodes to extend through said plurality of second electrodes and said

plurality of insulating layers to reach a surface of said plurality of first electrodes,

said at least one hole has a first diameter d1 at a position where said plurality of insulating

layers are in contact with said plurality of first electrodes and a second diameter d2 at a position

where said plurality of insulating layers are in contact with said plurality of second electrodes,

where d2 is greater than d1,

a nanofiber-structure layer is provided on said plurality of first electrodes in an opening

portion having said first diameter d1 in said at least one hole,

said plurality of insulating layers are each formed by firing a paste material made of resin

containing glass powder dispersed therein, and

11

Application No. 10/811,980 Amendment dated June 9, 2006 Reply to Office Action of March 9, 2006

a softening point of said glass powder used for said plurality of insulating layers decreases in the order of getting closer to said plurality of second electrodes.
